He explains, "a connectome is the totality of connections between the neurons in a nervous system. The term, like 'genome,' implies completeness. A connectome is not one connection, or even many. It is ALL of them. In principle, your brain could also be summarized by a diagram that is like the worm's, though much more complex.

Seung has written a clear and remarkably accessible introduction to the connectome - the physical wiring of the brain. But it is also a visionary work, arguing persuasively that the essence of personal identity consists in the information that the connectome instantiated. A fascinating book, but sadly lacking in formal references.

One of the leaders in the emerging science of connectomics, Seung believes that mapping the connectome could provide some fundamental answers to understanding our memory, personality, even mental disorders. But this is a gargantuan quest; we're talking 100 billion neurons in a human brain. We spoke with Seung about his book, "Connectome: How the Brain's Wiring Makes Us Who We Are," and what he calls "a turning point in human history."
