With advanced analytics and predictive data modeling, Nelsen says, "researchers are changing the design of clinical trials to enable patients to be selected based on the genome of their tumor and to help streamline patient recruiting and decision-making during the clinical trial."

### Genomic Medicine, Data Modeling and Clinical Trials: 3 ...

Experimental Design. We propose a framework for developing and validating genomic signatures in randomized trials. Codevelopment of predictive and prognostic signatures can allow prediction of patient-level survival curves as basic diagnostic tools for treating individual patients.

### Developing and Validating Continuous Genomic Signatures in ...

Introduction. Genomic signatures are being developed for various diseases to estimate disease-related patient trajectories (prognostic signatures) and to predict patient-specific outcome to different treatments (predictive tools) [1-14].The ultimate clinical utility of a biomarker hinges on two fundamental questions: firstly, what is the added value of marker assessment in every patient in ...

### Genomic advances and their impact on clinical trial design

Why Choose Genomic Prediction? We have developed a novel, genome-wide molecular genotyping methodology for pre-implantation genetic testing of embryos. Our approach reduces disease risk and improves newborn health outcomes by identifying candidate embryos for implantation which are not at elevated genetic risk for known disorders.
