“I’ll clarify - the title should read How To Make A (Simple) Speaker Crossover”
Before designing the crossover, you need to know the crossover frequency and how steep the drop off will be. In my case I have a woofer that has an effective frequency range up to around 4000Hz. The range of the tweeter I’m using is from 2200Hz up to 20,000Hz.

How To Make A Speaker Crossover - IBUILDIT.CA

Once you have passive biamping taken care of, when you upgrade the system to active, all you have to do is remove the passive crossover from the loudspeaker, put the active crossover in the amp rack, and tune the system. * Not all passive crossovers contain simple filters.

The change in the crossover design that you made produced a tighter cleaner bass. My friend that was here from the audio club just sat their going wow, he thought that they could easily compete with 25 to \$30,000 speakers. After about a week the crossover designer made it over and he was also impressed.

Ryan, If you're talking about passive crossovers, then I don't think you can convert them from 3- to 2-way. Passive crossovers have fixed separate frequency bands for outputs and there's no easy way to recombine them. There are active crossovers that can switch from one mode to the other. But I've never seen a passive crossover that can do that.

signal after it is amplified by a single power amplifier, so that the amplified signal can be sent to two or more driver types, each of which cover different frequency ranges. These crossover are made entirely of passive components and circuitry; the term "passive" means that no additional power source is needed for the circuitry.

The other is to use complex high order passive crossovers designed with time alignment correction. This introduces other losses which are often more detrimental. Most domestic and professional passive speaker systems rarely use this correction. Active crossovers can have time alignment correction that does not contribute losses in other areas.
